INTRODUCTION

Q. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

A. My name is Harold Walker, III. My business mailing address is P. O. Box 80794,
Valley Forge, Pennsylvania 19484.

Q. BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

A. I am employed by Gannett Fleming Valuation and Rate Consultants, LLC as
Manager, Financial Studies.

**Q. WHAT IS YOUR EDUCATIONAL BACKGROUND AND EMPLOYMENT
EXPERIENCE?**

A. My educational background, business experience and qualifications are provided
in Appendix A.

SCOPE OF TESTIMONY

Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY?

A. The purpose of my testimony is to recommend an appropriate overall rate of return
that Palmetto Wastewater Reclamation LLC ("PWR" or the "Company") should be
afforded an opportunity to earn on its wastewater service rate base. My testimony is
supported by Exhibit HW-1, which is composed of 19 Schedules.

SUMMARY OF RECOMMENDATION

Q. WHAT IS YOUR RECOMMENDED COST OF EQUITY?

A. My recommendation is that PWR be permitted an overall rate of return of 8.45%, including a 10.75% cost of common equity, based upon the Company's capital structure at August 31, 2018. My recommended cost of common equity reflects PWR's unique risk characteristics.

Q. HOW DID YOU DETERMINE YOUR RECOMMENDED COMMON EQUITY COST RATE?

A. I used several models to help me in formulating my recommended common equity cost rate including Discounted Cash Flow ("DCF"), Capital Asset Pricing Model ("CAPM") and Risk Premium ("RP").

Q. IS IT IMPORTANT TO USE MORE THAN ONE MARKET MODEL?

A. Yes. It is necessary to estimate common equity cost rates using a number of different models. At any given time, a particular model may understate or overstate the cost of equity. While any single investor may rely solely upon one model, different investors rely on different models and many investors use multiple models. Therefore, because the price of common stock reflects a number of valuation models, it is appropriate to estimate the market-required common equity cost rate by applying a broad range of analytical models.

1 **Q. PLEASE SUMMARIZE YOUR COMMON EQUITY COST RATE**
 2 **RECOMMENDATION.**

3 A. There is no market data concerning PWR's shares of common stock because PWR
 4 shares of common stock are not publicly traded. Accordingly, due to the lack of market
 5 data concerning the PWR's equity, I used a comparable group of publicly traded companies
 6 to estimate the common equity cost rate. Based upon the results of my entire analysis, I
 7 conclude PWR's current common equity cost rate is at least 10.75%. The current range of
 8 common equity cost for PWR is 10.50% (DCF), 10.80% (CAPM), and 11.10% (RP).
 9 Value Line Investment Survey ("Value Line") is relied upon by many investors and is the
 10 only investment advisory service of which I am aware that projects earned return on equity.
 11 As a check on the reasonableness of my common equity cost rate recommendation, I
 12 reviewed Value Line's projected returns on common equity for comparable utilities.
 13 Value Line's projected earned returns on common equity for my comparable utilities range
 14 from 10.5% to 14.0%. The range of the projected returns suggests that my
 15 recommendation that PWR be permitted an opportunity to earn 10.75% is reasonable, if
 16 not conservative.

17
 18 **PRINCIPLES OF RATE REGULATION AND FAIR RATE OF RETURN**

19 **Q. WHAT ARE THE PRINCIPLES GUIDING FAIR RATES OF RETURN IN THE**
 20 **CONTEXT OF RATE REGULATION?**

21 A. In a capitalistic or free market system, competition determines the price for all
 22 goods and services. Utilities are permitted to operate as monopolies or near monopolies
 23 as a tradeoff for a ceiling on the price of service because: (1) the services provided by

1 utilities are considered necessities by society; and (2) capital-intensive and long-lived
 2 facilities are necessary to provide utility service. Generally, utilities are required to serve
 3 all customers in their service territory at reasonable rates determined by regulators. As a
 4 result, regulators act as a substitute for a competitive-free market system when they
 5 authorize prices for utility service.

6 Although utilities operate in varying degrees as regulated monopolies, they must
 7 compete with governmental bodies, non-regulated industries, and other utilities for labor,
 8 materials, and capital. Capital is provided by investors who seek the highest return
 9 commensurate with the perceived level of risk; the greater the perceived risk, the higher
 10 the required return rate. In order for utilities to attract the capital required to provide
 11 service, a fair rate of return should equal an investor-required, market-determined rate of
 12 return.

13
 14 **Q. WHAT CONSTITUTES A FAIR RATE OF RETURN?**

15 A. Two noted Supreme Court cases define the benchmarks of a fair rate of return. In
 16 *Bluefield*¹, a fair rate of return is defined as: (1) equal to the return on investments in other
 17 business undertakings with the same level of risks (the comparable earnings standard);
 18 (2) sufficient to assure confidence in the financial soundness of a utility (the financial
 19 integrity standard); (3) adequate to permit a public utility to maintain and support its credit,
 20 enabling the utility to raise or attract additional capital necessary to provide reliable service
 21 (the capital attraction standard). The second case, *Hope*², determined a fair rate of return

¹*Bluefield Water Works & Improvement Company v. P.S.C. of West Virginia*, 262 U.S. 679 (1923).

²*Federal Power Commission v. Hope Natural Gas Company*, 320 U.S. 591 (1944).

1 to be based upon guidelines found in *Bluefield* as well as stating that: (1) allowed revenues
2 must cover capital costs including service on debt and dividends on stock; and (2) the
3 Commission was not bound to use any single formula or combination of formulae in
4 determining rates. Utilities are not entitled to a guaranteed return. However, the
5 regulatory-determined price for service must allow the utility a fair opportunity to recover
6 all costs associated with providing the service, including a fair rate of return.

8 **INVESTMENT RISK**

9 **Q. PREVIOUSLY, YOU REFERRED TO RISK. PLEASE DEFINE THE TERM**
10 **RISK.**

11 A. Risk is the uncertainty associated with a particular action; the greater the
12 uncertainty of a particular outcome, the greater the risk. Investors who invest in risky
13 assets expose themselves to investment risk particular to that investment. Investment risk
14 is the sum of business risk and financial risk. Business risk is the risk inherent in the
15 operations of a business. Assuming that a Company is financed with 100% common
16 equity, business risk includes all operating factors that affect the probability of receiving
17 expected future income such as: sales volatility, management actions, availability of
18 product substitutes, technological obsolescence, regulation, raw materials, labor, size and
19 growth of the market served, diversity of the customer base, economic activity of the area
20 served, and other similar factors.

21 **Q. WHAT IS FINANCIAL RISK?**

22 A. Financial risk reflects the manner in which an enterprise is financed. Financial
23 risk arises from the use of fixed cost capital (leverage) such as debt and/or preferred stock,

1 because of the contractual obligations associated with the use of such capital. Because the
2 fixed contractual obligations must be serviced before earnings are available for common
3 stockholders, the introduction of leverage increases the potential volatility of the earnings
4 available for common shareholders and therefore increases common shareholder risks.

5 Although financial risk and business risk are separate and distinct, they are
6 interrelated. In order for a company to maintain a given level of investment risk, business
7 risk and financial risk should complement one another to the extent possible. For
8 example, two firms may have similar investment risks while having different levels of
9 business risk, if the business risk differences are compensated for by using more or less
10 leverage (financial risk) thereby resulting in similar investment risk.

11 12 **DESCRIPTION OF PWR**

13 **Q. PLEASE GIVE A BRIEF DESCRIPTION OF THE COMPANY.**

14 A. Palmetto Wastewater Reclamation LLC is a Delaware limited partnership
15 authorized to conduct business in the State of South Carolina and which provides sewer
16 service in areas of Richland and Lexington counties of South Carolina. Palmetto
17 Wastewater Reclamation LLC does business as business as Palmetto Wastewater
18 Reclamation - Alpine Utilities and Palmetto Wastewater Reclamation - Woodland Utilities.
19 Ni South Carolina Utilities LLC is the direct parent of Palmetto Wastewater Reclamation
20 LLC and Ni South Carolina Utilities LLC is owned by Ni Pacolet Milliken Utilities, LLC.
21 PWR provides wastewater services to approximately 1,700 customers who are located in
22 their franchise territory in Richland and Lexington counties of South Carolina. The price

1 of service of PWR is regulated by the Public Service Commission of South Carolina
2 (“Commission” or “PSC”).
3

4 **THE INDUSTRY**

5 **Q. PLEASE GIVE A BRIEF OVERVIEW OF THE INDUSTRY IN WHICH THE**
6 **COMPANY OPERATES.**

7 A. PWR operates in the wastewater supply industry. The wastewater utility industry
8 has a Standard Industrial Classification (“SIC”) code of 4952 (Sewerage Systems), has
9 sewer utilities, and includes establishments primarily engaged in the collection and
10 disposal of wastes conducted through a sewer system, including such treatment processes
11 as may be provided. There are currently 1,861 U.S. Businesses with an SIC code of 4952.
12 A comparative industry to the wastewater supply industry is the water supply industry.
13 The water supply industry has an SIC code of 4941, has water utilities, and includes
14 establishments primarily engaged in distributing water for sale for residential, commercial,
15 and industrial uses. Government controlled establishments such as municipalities, public
16 service districts and other local governmental entities dominate the industry. Private
17 companies or investor owned utilities (“IOU”) are active in the construction and
18 improvement of water supply facilities and infrastructure. There are currently 9,538 U.S.
19 Businesses with an SIC code of 4941.

20 The water supply industry is the most fragmented of the major utility industries
21 with more than 53,000 community water systems in the U.S. (83% of which serve less than
22 3,300 customers). The nation’s water systems range in size from large municipally owned

1 systems, such as the New York City water system that serves approximately 9 million
2 people, to small systems, where a few customers share a common well.

3 According to the U.S. Environmental Protection Agency's ("EPA") most recent
4 survey of publicly-owned wastewater treatment facilities in 2008, there are approximately
5 15,000 such facilities in the nation, serving approximately 74% of the U.S. population.
6 Eighty percent of domestic wastewater systems are government owned rather than IOUs.
7 Currently, there are no wastewater utility companies that have actively traded stock.³

8 An estimated 14% of all water supplies are managed or owned by IOUs. IOUs
9 consist of companies with common stock that is either actively traded or inactively traded,
10 as well as companies that are closely held, or not publicly traded. Currently, there are only
11 about 10 investor owned water utility companies with publicly traded stock in the U.S.

12 The wastewater utility industry's and water utility industry's increased compliance
13 with state and federal water purity levels and large infrastructure replacements are driving
14 consolidation of the wastewater utility and water utility industries. Because many
15 wastewater utility and water utility operations do not have the means to finance the
16 significant capital expenditures needed to comply with these requirements, many have been
17 selling their operations to larger, financially stronger operations.

18 The larger IOUs have been following an aggressive acquisition program to expand
19 their operations by acquiring smaller wastewater and water systems. Generally, they enter
20 a new market by acquiring one or several wastewater or water utilities. After their initial
21 entry into a new market, the larger investor-owned water utility companies continually seek

³ Many of the publicly traded water utility stocks also own some wastewater utilities but there are no publicly traded utility stocks which are comprised solely of wastewater utilities.

1 to expand their market share and services through the acquisition of wastewater and water
2 utility businesses and operations that can be integrated with their existing operations.
3 Such acquisitions may allow a company to expand market share and increase asset
4 utilization by eliminating duplicate management, administrative, and operational
5 functions. Acquisitions of small, independent utilities can often add earning assets
6 without necessarily incurring the costs associated with the SDWA if such acquisitions are
7 contiguous to the potential purchaser.

8 In summary, the result of increased capital spending, to meet the SDWA
9 requirements⁴ and replace the aging infrastructure of many systems, has moved the
10 wastewater and water industries toward consolidation. Moreover, Federal and State
11 regulations and controls concerning water quality are still in the process of being developed
12 and it is not possible to predict the scope or the enforceability of regulations or standards
13 which may be established in the future, or the cost and effect of existing and potential
14 regulations and legislation upon PWR. However, as a smaller wastewater system, PWR
15 faces the cost of compliance with less financial resources when compared to larger IOU
16 water utilities.

⁴ The SDWA, or Safe Drinking Water Act, is the principal federal law in the United States intended to ensure safe drinking water for the public. Pursuant to the act, the EPA is required to set standards for drinking water quality and oversee all states, localities, and water suppliers who implement these standards. The CWA, or Clean Water Act, is the primary federal law in the United States governing water pollution. The CWA's objective is to restore and maintain the chemical, physical, and biological integrity of the nation's waters by preventing point and nonpoint pollution sources, providing assistance to publicly owned treatment works for the improvement of wastewater treatment, and maintaining the integrity of wetlands.

COMPARABLE GROUP

Q. HOW DO YOU ESTIMATE THE COST OF COMMON EQUITY FOR PWR?

A. PWR is a private limited liability company without publicly traded common stock. Accordingly, I employed a comparable group of utility companies with actively traded stock, to determine a market-required cost rate of common equity capital for PWR. Since no companies are perfectly identical to PWR, it is reasonable to determine the market-required cost rate for a comparable group of utility companies and adjust, to the extent necessary, for investment risk differences between PWR and the comparable group.

Q. HOW DID YOU SELECT THE COMPARABLE GROUP USED TO DETERMINE THE COST OF COMMON EQUITY FOR PWR?

A. I selected a comparable group of water utilities to determine the cost of common equity for PWR considering security analysts' coverage. Unlike the other utility industries, only a portion of the IOU water companies with publicly traded stock in the U.S. are followed by security analysts. Coverage by security analysts is important when determining a market required cost of common equity. Accordingly, security analysts' coverage was considered when selecting my comparable group. I selected my water utility comparable group, Water Group Followed by Analysts ("Water Group"), based upon a general criteria that includes: (1) all U.S. water utilities who are covered by several security analysts as measured by the existence of several sources of published projected five-year growth rates in earnings per share ("EPS"); (2) with a Global Industry Classification

Standard⁵ (“GICS”) of 55104010 (*i.e.*, Water Utility); (3) are not the announced subject of an acquisition; (4) currently pay a common dividend and have not reduced their common dividend within the past four years; and (5) have market capitalization greater than \$75.0 million.

It should be noted that the Water Group is also referred to as the Comparable Group and/or the Comparable Companies.⁶ The names of the utilities that comprise the Comparable Group and their bond or credit ratings are listed in Table 1.

Table 1

Bond and Credit Ratings for <u>The Water Group Followed by Analysts</u>	
	<u>S&P Credit Rating</u>
<u>Water Group Followed by Analysts</u>	
American States Water Co	A+
American Water Works Co Inc	A
Aqua America Inc *	A+
California Water Service Gp **	A+
Middlesex Water Co	A
SJW Corp ***	A
York Water Co	A-
Average	<u>A</u>
* - The A+ bond rating is that for Aqua Pennsylvania, Inc.	
** - The A+ bond rating is that for California Water Service Co., Inc.	
*** - The A bond rating is that for San Jose Water Co.	

⁵ GICS is an eight-digit code that represents a company’s Global Industry Classification Standard that was developed by Standard & Poor’s and Morgan Stanley Capital International. The eight-digit code can be broken down according to a hierarchy of economic sectors, industry groups, industries and sub-industries: All Economic Sectors are represented by the leftmost two-digits; Industry Groups are represented by the combination of the leftmost four-digits; Industries are represented by the combination of the leftmost six-digits; and Sub-Industries are represented by the combination of the leftmost eight-digits.

⁶ Six of the Comparable Companies also provide some wastewater service. SJW Corp. is the only company in the Water Group that does not also provide wastewater service.

Q. WHY DID YOU INCLUDE NOT BEING THE SUBJECT OF AN ACQUISITION AS A CRITERIA FOR THE WATER GROUP?

A. To begin with, there are only about 10 investor owned water utility companies with publicly traded stock in the U.S., and some of these companies are very small. As stated previously, the IOU water industry receives only limited exposure on Wall Street.

Additionally, the merger activity in the water industry can result in abnormal or “tainted” stock prices in terms of a DCF analysis because premiums are typically paid in corporate acquisitions. That is, when a tender offer is made for the purchase of all the outstanding stock of a company, the amount of that offer usually exceeds the price at which the stock was previously traded in the market. These large premiums are often reflected in the prices of other water utilities that are not currently the announced subject of an acquisition.⁷

CAPITAL STRUCTURE

Q. WHAT IS REQUIRED TO DEVELOP AN OVERALL RATE OF RETURN?

A. The first step in developing an overall rate of return is the selection of capital structure ratios to be employed. Next, the cost rate for each capital component is determined. The overall rate of return is the product of weighting each capital component by its respective capital cost rate. This procedure results in PWR’s overall rate of return being weighted proportionately to the amount of capital and cost of capital of each type of capital.

⁷ Multiple publications mention these impacts including Research Magazine – April, 2010, Barron’s – March 2001, Utility Business – June 2002, and Value Line Investment Survey – April 2013.

1 **Q. DOES PWR DIRECTLY RAISE OR ISSUE ITS OWN DEBT CAPITAL?**

2 A. No, PWR's indirect parent, Ni Pacolet Milliken Utilities, LLC, raises the debt
3 capital that is allocated to PWR.

4 **Q. WHAT CAPITAL STRUCTURE RATIOS ARE APPROPRIATE TO BE USED TO**
5 **DEVELOP PWR'S OVERALL RATE OF RETURN?**

6 A. Consistent with settled rate setting principles, I believe it is necessary to evaluate
7 PWR's current cost of capital based on their August 31, 2018 capital structure, which
8 includes 40.3% debt and 59.7% common equity as reflected in Schedule 1. These ratios
9 synchronize capitalization with rate base.

10
11 **Q. HOW DOES YOUR RECOMMENDED CAPITAL STRUCTURE COMPARE**
12 **WITH RATIOS EMPLOYED BY OTHER INVESTOR-OWNED COMPANIES?**

13 A. The capital structure I recommend for PWR reflects a common equity ratio of
14 59.7% which falls within the range of the ratios employed by other investor-owned water
15 companies as shown on pages 1 and 2 of Schedule 2. A comparison of my
16 recommendation for PWR's capital structure ratios to those recently employed and
17 forecasted to be employed by the Comparison Group is shown in Table 2.

Table 2

<u>Comparison of Capital Structure Ratios</u>			
	<u>PWR</u>	<u>Water Group</u>	
	<u>At</u>	<u>At</u>	<u>Projected</u>
	<u>8/31/2018</u>	<u>9/30/2018</u>	<u>2022</u>
Debt	40.3	45.8	44.8
Preferred Stock	0.0	0.1	0.1
Common Equity	<u>59.7</u>	<u>54.1</u>	<u>55.1</u>
	<u>100.0</u>	<u>100.0</u>	<u>100.0</u>

The PWR's rate making capital structure ratios are reasonable based upon the above information. Moreover, PWR's smaller size justifies the use of more equity capital than the Comparison Group in order to counterbalance some of the risk associated with its size. The size of a company is an indicator of risk and is discussed later in my testimony in more detail.

EMBEDDED COST RATE

Q. WHAT EMBEDDED COST RATES DO YOU RECOMMEND BE USED TO CALCULATE PWR'S OVERALL RATE OF RETURN?

A. Consistent with my recommended capitals structure ratios I recommend using PWR's embedded debt cost rate of 5.04% for PWR as reflected and developed in Schedule 1. The determination of an embedded cost rate is a relatively simple arithmetic exercise because a company has contracted for this capital for a specific period of time and at a specific cost, including issuance expenses and coupon rate.

FINANCIAL ANALYSIS

Q. HAVE YOU REVIEWED HISTORICAL FINANCIAL INFORMATION OF PWR AS PART OF YOUR ANALYSIS?

A. Yes. On page 1 of Schedule 3, I developed a five-year analysis, ending in 2017, detailing various financial ratios for PWR. On Schedule 4, I performed a similar five-year analysis for the Water Group. Schedule 5 reveals the results of operations for a large broad-based group of utilities known as the Standard & Poor's ("S&P") Utilities for the five years ending 2017. This information is useful in determining relative risk differences between different types of utilities.

Comparing PWR, the Comparable Group and the S&P Utilities' coverage of fixed charges and the various cash flow coverage proves that the Comparable Group has experienced a higher level of coverage than the S&P Utilities. Reviewing PWR's various cash flow coverage show PWR has had similar but higher level of coverage than the Comparable Group.

Q. WHAT DO YOU CONCLUDE FROM THE COMPARISON OF ALL THE INFORMATION SHOWN ON SCHEDULES 3 THROUGH 5?

A. Taken together, these comparisons show that PWR is exposed to risk that is similar in nature but greater in degree compared with the Comparable Groups. This is evident in particular when one considers the size and diversification of PWR, or lack thereof, as compared to the Comparable Companies. Prospectively, the magnitude of PWR's future

construction expenditures will place downward pressure on PWR's financial ratios as measured by interest coverage and cash generation.

Q. WHAT INFORMATION IS SHOWN ON SCHEDULE 6?

A. Schedule 6 lists the names, issuer credit ratings, common stock rankings, betas and market values of the companies contained in the Comparable Group and the S&P Utilities. As is evident from the information shown on Table 3, the Comparable Group and the S&P Utilities are similar to each other in risk.

Table 3

	<u>S&P Issuer Credit Rating</u>	<u>S&P Common Stock Ranking</u>	<u>Value Line Beta</u>	<u>Recent Market Value</u> (Mill \$)	<u>Market Quartile Name</u>
Water Group	A	Above Average (A-)	0.71	2,197.669	Low-Cap
S&P Utilities	BBB+	Average (B+)	0.69	25,682.945	Large-Cap

The Water Group's average issuer credit ratings and common stock rankings are higher than the S&P Utilities. The average beta of the Comparable Group, 0.71, is similar to the average beta of the S&P Utilities, 0.69. Beta is a measure of volatility or market risk, the higher the beta, the higher the market risk. The market values provide an indication of the relative size of each group. As a generalization, the smaller the average sizes of a group, the greater the risk.

Page 2 of Schedule 7 shows that PWR has experienced the lowest return on equity (“ROE”) when compared to the Comparable Companies. Further, the Comparable Companies’ dividend payout ratio is higher than PWR’s, as PWR does not pay dividends. S&P, the predominant bond rating agency, considers profit to be a fundamental determinant of credit protection. S&P states that a firm’s profit level:

Whether generated by the regulated or deregulated side of the business, profitability is critical for utilities because of the need to fund investment-generating capacity, maintain access to external debt and equity capital, and make acquisitions. Profit potential and stability is a critical determinant of credit protection. A company that generates higher operating margins and returns on capital also has a greater ability to fund growth internally, attract capital externally, and withstand business adversity. Earnings power ultimately attests to the value of the company’s assets, as well. In fact, a company’s profit performance offers a litmus test of its fundamental health and competitive position.

Accordingly, the conclusions about profitability should confirm the assessment of business risk, including the degree of advantage provided by the regulatory environment.⁸

Q. WHAT INFORMATION IS SHOWN ON SCHEDULE 7?

A. Schedule 7 reveals the capital intensity and capital recovery for PWR, the Comparable Companies and the S&P Utilities. Based upon the 2017 capital intensity ratio of plant to revenues, PWR (\$9.09) is more capital intensive as compared to the Water Group (\$5.82) and more than the S&P Utilities (\$4.17). From a purely financial point of view, based on current accounting practices, the rate of capital recovery or depreciation rate is an indication of risk because it represents cash flow and the return of an investment. PWR’s average rate of capital recovery is lower than the Comparable Group’s, suggesting more risk.

⁸ Standard & Poor’s Ratings Services, *Criteria, Utilities: Key Credit Factors: Business And Financial Risks In The Investor-Owned Utilities Industry*, Nov. 26, 2008, pgs. 8-9.

The return on equity and depreciation expense provides the margin for coverage of construction expenditures. For a utility company, depreciation expense is the single largest generator of cash flow. From a financial analyst's point of view, cash flow is the life blood of a utility company. Without it, a utility cannot access capital markets, it cannot construct plant, and therefore, it cannot provide service to its customers.

RISK ANALYSIS

Q. PLEASE EXPLAIN THE INFORMATION SHOWN ON SCHEDULE 8.

A. Schedule 8 details the size difference between PWR and the Comparable Group. Company size is an indicator of business risk and is summarized in Table 4.

Table 4

<u>Number of Times Larger Than the PWR</u>	
	<u>Water Group</u>
Capitalization	107.2x
Revenues	252.1x
Number of Customers	467.4x

As shown in Table 4, PWR is much smaller than the Water Group. The size of a company affects risk. A smaller company requires the employment of proportionately less financial leverage (*i.e.*, debt and preferred capital) than a larger company to balance out investment risk. If investment risk is not balanced out, then a higher cost of capital is required.

1 **Q. WHY IS SIZE SIGNIFICANT TO YOUR ANALYSIS?**

2 A. The size of a company can be likened to ships on the ocean, since a large ship has
3 a much better chance of weathering a storm than a small ship. The loss of a large customer
4 will impact a small company much more than a large company because a large customer
5 of a small company usually accounts for a larger percentage of the small company's sales.

6 Moreover, a larger company is likely to have a more diverse geographic operation
7 than a smaller company, which enables it to sustain earnings fluctuations caused by
8 abnormal weather in one portion of its service territory. A larger company operating in
9 more than one regulatory jurisdiction enjoys "regulatory diversification" which makes it
10 less susceptible to adverse regulatory developments or eminent domain claims in any single
11 jurisdiction. Further, a larger company with a more diverse customer base is less
12 susceptible to downturns associated with regional economic conditions than a small
13 company. For example, on average, the average company in the Water Group provides
14 water/sewer service in multiple states for about 795,000 customers. The average
15 population of the communities served by the average company in the Water Group is about
16 3.2 million people. These wide-ranging operations provide the Water Group substantial
17 geographic, economic, regulatory, weather and customer diversification. PWR provides
18 regulated wastewater service to about 1,700 customers. The concentration of PWR's
19 business in central South Carolina makes it very susceptible to any adverse development
20 in local regulatory, economic, demographic, competitive and weather conditions.

21 Further, S&P, a major credit rating agency, recognizes the importance that
22 diversification and size play in credit ratings. S&P believes some of the critical factors
23 include: regional and cross-border market diversification (mitigates economic,

demographic, and political risk concentration); customer diversification; and regulatory regime diversification.⁹

The size of a company can be a barrier to fluid access to capital markets (*i.e.*, liquidity risk). Investors require compensation for the lack of marketability and liquidity of their investments. If no compensation is provided, then investors, or at least sophisticated investors, shy away.

Q. IS THE IMPACT OF SIZE COMMONLY RECOGNIZED?

A. Yes, the National Association of Regulatory Utility Commissioners (“NARUC”), as well as most good financial texts, recognizes that size affects relative business risk. Liquidity risk and the existence of the small firm effect relating to business risk of small firms are well-documented in financial literature.¹⁰ Investors’ expectations reflect the highly-publicized existence of the small firm effect. For example, many mutual funds classify their investment strategy as small capitalization in an attempt to profit from the existence of the small firm effect.

As previously discussed, S&P recognizes that size plays a role in credit ratings.

Standard & Poor’s has no minimum size criterion for any given rating level. However, size turns out to be significantly correlated to ratings. The reason: size often provides a measure of diversification, and/or affects competitive position. . . . Small companies are, almost by definition, more concentrated in terms of product, number of customers, or geography. In effect, they lack some elements of diversification that can benefit larger companies. To the extent that markets and regional economies change, a broader scope of business affords protection. This consideration is

⁹ Standard & Poor’s, Corporate Ratings Criteria, Utilities: Key Credit Factors: Business And Financial Risks In The Investor-Owned Utilities Industry, Nov. 26, 2008.

¹⁰ Banz, Rolf, W. “The Relationship Between Return and Market Value of Common Stocks,” *Journal of Financial Economics*, 9:3-18 1981. For subsequent studies see Fama and French, etc.

1 balanced against the performance and prospects of a given business.
 2 . . . In addition, lack of financial flexibility is usually an important
 3 negative factor in the case of very small companies. Adverse
 4 developments that would simply be a setback for companies with
 5 greater resources could spell the end for companies with limited
 6 access to funds.¹¹
 7

8 As shown on Schedule 9, size plays a role in the composition of investors, and hence
 9 liquidity. In 2017, about 83% of the Water Group's shares traded while the larger
 10 companies comprising the S&P Utilities had a much higher trading volume of 156%.
 11 Insiders¹² hold more than seven times more, as a percent to total, of the Water Group's
 12 shares than the S&P Utilities. Currently, only about 61% of the Water Group shares are
 13 held by institutions¹³ while the larger companies comprising the S&P Utilities had much
 14 higher institutional holdings of 78%. Due to small size and less interest by financial
 15 institutions, fewer security analysts follow the Comparable Group and none follow PWR.

16 The lack of trading activity may affect the cost of equity estimates for small entities
 17 such as PWR and the Water Group. When stock prices do not change because of inactive
 18 trading activity, estimates of dividend yield for use in a dividend cash flow model and beta
 19 estimates for use in the capital asset pricing model are affected. In a stock market that is
 20 generally up, the beta estimates for the Comparable Companies may be understated due to
 21 thin trading.

¹¹ *Standard & Poor's, Corporate Ratings Criteria 2006*; pg. 22.

¹² An insider is a director or an officer who has a policy-making role or a person who is directly or indirectly the beneficial owner of more than 10% of a certain company's stock.

¹³ Institutional holders are those investment managers having a fair market value of equity assets under management of \$100 million or more. Certain banks, insurance companies, investment advisers, investment companies, foundations and pension funds are included in this category.

1 **Q. DO PWR AND THE COMPARABLE COMPANIES HAVE SIMILAR**
2 **OPERATING RISKS?**

3 A. Yes. From an operations standpoint, PWR and the Comparable Companies have
4 similar risks and are indistinguishable. Both are required to meet Clean Water Acts and
5 Safe Drinking Water Act requirements and are also required to provide safe and reliable
6 services to their customers and comply with Commission regulations.
7

8 **Q. IS THERE ANY SINGLE MEASURE THAT BEST SHOWS INVESTMENT RISK**
9 **FROM A COMMON STOCKHOLDER'S PERSPECTIVE?**

10 A. No. However, from a creditor's viewpoint, the best measure of investment risk is
11 debt rating. The debt rating process generally provides a good measure of investment risk
12 for common stockholders because the factors considered in the debt rating process are
13 usually relevant factors that a common stock investor would consider in assessing the risk
14 of an investment. Credit rating agencies, such as S&P, assess the risk of an investment
15 into two categories based on: fundamental business analysis; and financial analysis.¹⁴ The
16 business risk analysis includes assessing: Country risk; industry risk; competitive position;
17 and profitability/peer group comparisons. The financial risk analysis includes assessing:
18 accounting; financial governance and policies/risk tolerance; cash flow adequacy; capital
19 structure/asset protection; and liquidity/short-term factors.

¹⁴ *Standard & Poor's, Corporate Ratings Criteria*, General: Criteria Methodology: Business Risk/Financial Risk Matrix Expanded, May 27, 2009 and *Standard & Poor's, Criteria Corporates General: Corporate Methodology*, November 19, 2013.

Q. WHAT IS THE BOND RATING OF PWR AND THE COMPARABLE GROUP?

A. Page 1 of Schedule 10 shows the average bond/credit rating Comparable Group. The Comparable Group has an A credit profile and PWR does not have bonds rated. The major bond rating/credit rating agencies append modifiers, such as +, - for S&P and 1, 2, and 3 for Moody's Investors Service ("Moody's") to each generic rating classification. For example, an "A" credit profile is comprised of three subsets such as A+, A, A- for S&P or A1, A2 or A3 for Moody's. The modifier of either "+" or "1" indicates that the obligation ranks in the higher end of its generic rating category; the modifier "2" indicates a mid-range ranking; and the modifier of "-" or "3" indicates a ranking in the lower end of that generic rating category.

S&P and Moody's publish financial benchmark criteria necessary to obtain a bond rating for different types of utilities. As a generalization, the higher the perceived business risk, the more stringent the financial criteria so the sum of the two, business risk and financial criteria, remains the same.

Q. WHAT ARE SOME FINANCIAL BENCHMARKS APPLIED BY CREDIT RATING AGENCIES FOR RATING PUBLIC UTILITY DEBT?

A. S&P describes their range of financial benchmarks as

Risk-adjusted ratio guidelines depict the role that financial ratios play in Standard & Poor's rating process, since financial ratios are viewed in the context of a firm's business risk. A company with a stronger competitive position, more favorable business prospects, and more predictable cash flows can afford to undertake added financial risk while maintaining the same credit rating. The guidelines displayed in the matrices make explicit the linkage between financial ratios and levels of business risk.¹⁵

¹⁵ Standard & Poor's Corporate Rating Criteria, 2000.

1 **Q. WHAT OTHER INFORMATION IS SHOWN ON SCHEDULE 10?**

2 A. Page 2 of Schedule 10 summarizes the application of S&P's and Moody's measures
3 of financial risk for PWR and the Comparable Group. S&P's and Moody's measures of
4 financial risk are broader than the traditional measure of financial risk (i.e.,leverage).
5 Besides reviewing amounts of leverage employed, S&P and Moody's also focuses on
6 earnings protection and cash flow adequacy.

7 As is evident from the information shown on page 2 of Schedule 10, for the five
8 years ending in 2017 and for the year 2017, PWR's cash flow adequacy ratios were similar
9 to the Comparable Companies in most instances. Comparing the PWR and the Water
10 Group's measures of cash flow adequacy show that the Water Group has experienced a
11 similar level of cash flow adequacy as PWR; indicating that PWR is a similar investment
12 risk than the Water Group. Prospectively, based upon the Company's construction
13 program, the Company's ratios are likely to be strained. Based solely upon PWR's
14 historical ratios, it is my opinion that PWR's credit profile is similar to the Comparable
15 Companies.

16 However, based solely upon PWR's size, it is my opinion that PWR's credit profile
17 is lower than the Comparable Groups'. Based on PWR's small size, it is highly likely that
18 PWR's credit profile is below BBB (i.e., BB). An analysis of corporate credit ratings,
19 shown on page 4 of Schedule 10, indicates that there is an 92% (100%-0%-0%-5%-
20 3%=92%) chance that PWR's credit profile falls below BBB based on their small size
21 alone. As S&P has stated, size is significantly correlated to credit ratings. An analysis
22 of corporate credit ratings found The York Water Company to be the smallest utility with

1 a credit rating. Their credit rating is only A- despite having a capitalization comprised of
2 more than \$199 million and a common equity ratio in excess of 57%.

3 In order to compete with the Comparable Group for capital, in the future, it will be
4 necessary for PWR to achieve higher returns on equity, and increased cash flow just to
5 maintain a similar credit quality.

6 S&P has stated:

7 ... low authorized returns may affect the industry's ability to attract necessary
8 capital to develop new water supplies and upgrade the quality of existing
9 supplies . . . Traditional ratemaking policy has not provided sufficient credit
10 support during the construction cycle of the electric industry over the past 15
11 years. To avoid a repeat in the water industry, regulators must be aware of
12 the increased challenges the industry faces.¹⁶ (Emphasis added)
13

14 Investors will not provide the equity capital necessary for increasing the amount of
15 common equity in a capital structure unless the regulatory authority allows an adequate
16 rate of return on the equity.¹⁷
17

18 **Q. WHAT DO YOU CONCLUDE FROM THE VARIOUS MEASURES OF**
19 **INVESTMENT RISK INFORMATION YOU HAVE TESTIFIED TO?**

20 A. A summary of my conclusions regarding the risk analyses discussed previously is
21 shown in Table 5. Overall, the information summarized in Table 5 indicates that PWR is
22 a similar, but higher investment risk as the Water Group.

¹⁶ Standard & Poor's CreditWeek, May 25, 1992.

CAPITAL COST RATES5 **Q. WHAT INFORMATION IS SHOWN ON SCHEDULE 11?**

6 A. Schedule 11 reviews long-term and short-term interest rate trends. Long-term and
7 short-term interest rate trends are reviewed to ascertain the “sub-flooring” or “basement”
8 upon which the Comparable Companies’ common equity market capitalization rate is built.
9 Based upon the settled yields implied in the Treasury Bond future contracts and the long-

1 term and recent trends in spreads between long-term government bonds and A-rated public
2 utility bonds available to me at the time Schedule 11 was prepared, I conclude that the
3 market believes that if the Comparable Companies issued new long-term bonds near term,
4 they would be priced to yield about 4.6% based upon a credit profile of "A." Further, it
5 is reasonable to conclude the market anticipates that long-term government bonds will be
6 priced to yield about 3.4%, near term.

7 However, prospectively, over the next couple of years, forecasters believe capital
8 costs rates may increase substantially from their current levels. Recently, former Federal
9 Reserve Chairman Alan Greenspan warned that the bond market is on the edge of a collapse
10 that would bring much higher interest rates and may also impact stock prices.

11 In a CNBC interview, the longtime central bank chief said the prolonged
12 period of low interest rates is about to end and, with it, a bull market in fixed
13 income that has lasted more than three decades.

14 "The current level of interest rates is abnormally low and there's only one
15 direction in which they can go, and when they start they will be rather
16 rapid," Greenspan said on "Squawk Box."

17 That low interest rate environment has been the product of current monetary
18 policy at the institution he helmed from 1987-2006. The Fed took its
19 benchmark rate to near zero during the financial crisis and kept it there for
20 seven years after.

21 Since December 2015, the Fed has approved four rate hikes, but government
22 bond yields remained mired near record lows.

23 Greenspan did not criticize the policies of the current Fed. But he warned
24 that the low rate environment can't last forever and will have severe
25 consequences once it ends.

26 "I have no time frame on the forecast," he said. "I have a chart which goes
27 back to the 1800s and I can tell you that this particular period sticks out. But
28 you have no way of knowing in advance when it will actually trigger."

29 One point he did make about timing is it likely will be quick and take the
30 market by surprise.

31 "It looks stronger just before it isn't stronger," he said. Anyone who thinks
32 they can forecast when the bubble will break is "in for a disastrous"
33 experience."

34 In addition to his general work at the Fed, which also featured an extended
35 period of low rates though nowhere near their current position, Greenspan
36 is widely known for the "irrational exuberance" speech he gave at the

1 American Enterprise Institute in 1996. The speech warned about asset
2 prices and said it is difficult to tell when a bubble is about to burst.
3 Those remarks foreshadowed the popping of the dot-com bubble, and the
4 phrase has found a permanent place in the Wall Street lexicon.
5 “You can never be quite sure when irrational exuberance arises,” he told
6 CNBC. “I was doing it as part of a much broader speech and talking about
7 the analysis of the markets and the like, and I wasn’t trying to focus short
8 term. But the press loved that term.”¹⁸
9

10 Since October 2008, the Federal Reserve has been monetizing US Treasury debt to
11 artificially suppress interest rates through expansionary money policies. The Federal
12 Reserve, with effectively unlimited money at its disposal, intervenes at any time it wishes,
13 in whatever volume it wishes, to make sure that Treasury bond and bill prices and yields
14 are exactly what the Federal Reserve wants them to be. The US Treasury bond market, and
15 mortgage market, has become an artificial market with no connection to objective risk and
16 interest rates.

17 In August 2011, the Federal Reserve began “Operation Twist.” Under “Operation
18 Twist,” the Federal Reserve began buying \$400 billion of long-dated or long-term US
19 Treasury debt, financed by selling short-term US Treasury debt with three years to go or
20 less. The goal of “Operation Twist” was to try to drive long-term rates lower, which the
21 Federal Reserve thought would help the mortgage market. This process has created an
22 artificial demand for the US Treasury debt themselves, and easily drives interest rates
23 artificially lower and deceives investors into believing US Treasury debt are safe with wide
24 demand. This has resulted in the entire capital system being impacted by the Federal
25 Reserve’s distortion of the price of risk.

¹⁸ CNBC, Greenspan: Bond Bubble About to Break Because of ‘Abnormally Low’ Interest Rates, 8/4/17, <https://www.cnbc.com/2017/08/04/greenspan-bond-bubble-about-to-break-because-of-abnormally-low-interest-rates.html>, (8/4/17).

In the real world of economics, the borrower pays an interest rate to a lender, who makes money (interest) by taking on the risk of lending and deferring gratification. The lender is willing to not spend his money now. In a free market economy, interest rates are essentially a price put on money, and they reflect the time preference of people. Higher interest rates reflect a high demand for borrowing and lower savings. But the higher rates automatically correct this situation by encouraging savings and discouraging borrowing. Lower interest rates will work the opposite way. When the government/central bank tampers with interest rates, savings and lending are distorted, and resources are misallocated. This is evident in looking back on the housing bubble. The artificially low interest rates signaled that there was a high amount of savings. But it was a false signal. There was also a signal for people to borrow more. Again, it was a false signal. As these false signals were revealed, the housing boom turned into a bust.¹⁹

When there is a crisis in the markets, such as a financial meltdown, market participants usually sell off and move their money to a safer place; fleeing from illiquid, low quality investments to liquid, high quality investments. This flight to quality reflects a collapse of confidence in the financial system and is most evident in short-term interest rates. Prospectively the capital markets will be affected by the upcoming unprecedented large Treasury financings. Investors provide capital based upon risk and return opportunities and investors will not provide common equity capital when higher risk-adjusted returns are available.

Q. ARE THERE OTHER INDICATIONS THAT FORECASTERS BELIEVE CAPITAL COSTS RATES MAY INCREASE SUBSTANTIALLY FROM THEIR CURRENT LEVELS?

A. Yes, consensus forecasts show that interest rates are expected to increase substantially in the next few years. Table 6 shows the forecasted increase in interest rates

¹⁹ Pike, Geoffrey "The Threat of Negative Interest Rates," Wealth Daily, May 30, 2014, <http://www.wealthdaily.com/articles/the-threat-of-negative-interest-rates/5185>, (6/03/2014)

published in the December 1, 2017 Blue Chip Consensus Forecasts for the period 2020 to 2022. As shown in Table 6, consensus forecasts show interest rates are expected to increase over 80 basis points from current levels. If interest rates were to increase as predicted, investors will not provide common equity capital when higher risk-adjusted returns are available.

Table 6

COMMON EQUITY COST RATE ESTIMATE

Q. WHAT IS THE BEST METHOD OF ESTIMATING COMMON EQUITY COST RATES?

A. There is no single method (model) suitable for estimating the cost rate for common equity. While a single investor may rely solely upon one model in evaluating investment opportunities, other investors rely on different models. Most sophisticated investors who use an equity valuation model rely on many models in evaluating their common equity investment alternatives. Therefore, the average price of an equity security reflects the

1 results of the application of many equity models used by investors in determining their
2 investment decisions.

3 The application of any single model to estimate common equity cost rates is not
4 appropriate because the security price for which the equity cost rate is being estimated
5 reflects the application of many models used in the valuation of the investment. That is,
6 the price of any security reflects the collective application of many models. Accordingly,
7 if only one model is used to estimate common equity cost rates, that cost rate will most
8 likely be different from the collective market's cost rates because the collective valuation
9 in the market reflects more than one method.

10 Noted financial texts, investor organizations and professional societies all endorse
11 the use of more than one valuation method. "We endorse the dividend discount model,
12 particularly when used for establishing companies with consistent earnings power and
13 when used along with other valuation models. It is our view that, in any case, an investor
14 should employ more than one model."²⁰ (Emphasis added.)

15 The American Association of Individual Investors state, "No one area of investment
16 is suitable for all investors and no single method of evaluating investment opportunities
17 has been proven successful all of the time."²¹

18 In their study guide, the National Society of Rate of Return Analysts state, "No cost
19 of equity model or other concept is recommended or emphasized, nor is any procedure for
20 employing any model recommended . . . it remains important to recognize that alternative

²⁰ Sidney Cottle, Roger F. Murray and Frank E. Block, Graham and Dodd's Securities Analysis 5th Edition, McGraw-Hill, Inc., 1988, p. 568.

²¹ Editorial Policy, AAII Journal, American Association of Individual Investors, Volume 18, No. 1, January 1996, p. 1.

1 methods exist and have merit in cost of capital estimation. To this end, analysts should be
2 knowledgeable of a broad spectrum of cost of capital techniques and issues.”²²

3 Several different models should be employed to measure accurately the market-
4 required cost of equity reflected in the price of stock. Therefore, I used three recognized
5 methods including the DCF shown on Schedule 12, the CAPM shown on Schedule 17, and
6 the RP shown on Schedule 18.

8 **DISCOUNTED CASH FLOW**

9 **Q. PLEASE EXPLAIN THE DISCOUNTED CASH FLOW MODEL.**

10 A. The DCF is based upon the assumption that the price of a share of stock is equal to
11 a future stream of cash flows to which the holder is entitled. The stream of cash flows is
12 discounted at the investor-required cost rate (cost of capital).

13 Although the traditional DCF assumes a stream of cash flow into perpetuity, a
14 termination, or sale price can be calculated at any point in time. Therefore, the return rate
15 to the stockholder consists of cash flow (earnings or dividends) received and the change in
16 the price of a share of stock. The cost of equity is defined as:

17 ...the minimum rate of return that must be earned on equity finance
18 and investments to keep the value of existing common equity
19 unchanged. This return rate is the rate of return that investors
20 expect to receive on the Company’s common stock . . . the dividend
21 yield plus the capital gains yield . . . ²³(Emphasis added)
22

²² David C. Parcell, The Cost of Capital - A Practitioners Guide, National Society of Rate of Return Analysts, 1995 Edition.

²³ J. Fred Weston and Eugene F. Brigham, Essentials of Managerial Finance, 3rd ed. (The Dryden Press), 1974, p. 504.

1 **Q. PLEASE EXPLAIN HOW YOU CALCULATED YOUR DIVIDEND YIELD IN**
2 **THE DCF SHOWN ON SCHEDULE 12.**

3 A. As shown on page 1 of Schedule 12, I used the average dividend yield of 2.0% for
4 the Water Group. The individual dividend yields are shown on page 2 of Schedule 12 and
5 are based upon the most recent months' yield, November 2018, and the twelve-month
6 average yield, ending November 2018. The second input to a market DCF calculation is
7 the determination of an appropriate share price growth rate.
8

9 **Q. WHAT SOURCES OF GROWTH RATES DID YOU REVIEW?**

10 A. I reviewed both historical and projected growth rates. Schedule 13 shows the array
11 of projected growth rates for the Comparable Companies that are published. Specific
12 historical growth rates are shown for informational purposes because I believe the
13 meaningful historical growth rates are already considered when analysts arrive at their
14 projected growth rates. Nonetheless, some investors may still rely on historical growth
15 rates.
16

17 **Q. PLEASE EXPLAIN THE SOURCES OF THE PROJECTED GROWTH RATES**
18 **SHOWN ON SCHEDULE 13.**

19 A. I relied upon four sources for projected growth rates, First Call, Reuters, Zacks
20 Investment Research and Value Line.²⁴

²⁴ With the exception of Value Line, the earnings growth rate projections are consensus estimates five-year EPS estimates. These consensus estimates are compiled from more than 1,700 financial analysts and brokerage firms nationwide. It should be noted that none of the consensus forecasts provides projected DPS estimates. Value Line publishes projected Cash flow, EPS and DPS five-year growth projections as well.

Q. DID YOU REVIEW ANY OTHER GROWTH RATES BESIDES THOSE SHOWN ON SCHEDULE 13?

A. Yes. I reviewed EPS growth rates reflecting changes in return rates on book common equity (ROE) over time. I summarized recent ROEs on page 1 of Schedule 14, and compared those to the Water Group's higher levels projected to be achieved by Value Line, as shown on page 2 of Schedule 14. ROEs increase when EPS grows at much higher/faster rates than book value.

I also reviewed industry specific average projected growth rates that are published by Zacks for the industries in which the Comparable Companies operate. According to Zacks, the Water Group's industry is projected to have EPS growth rates that average 9.3% over the next five years.

Q. WHAT DO YOU CONCLUDE FROM THE GROWTH RATES YOU HAVE REVIEWED?

A. Table 7 summarizes some of the various growth rates reviewed.

Table 7

<u>Summary of Growth Rates</u>	
	<u>Water Group</u>
Projected 5 Year Growth in EPS	7.6
Actual 5 Year Growth in EPS	8.4
Projected 5 Year Growth in DPS	7.9
Projected 5 Year Growth in EPS for the industry	9.3

1 Academic studies suggest that growth rate conclusions should be tested for reasonableness
2 against long-term interest rate levels. Further, the minimum growth rate must at least
3 exceed expected inflation levels. Otherwise, investors would experience decreases in the
4 purchasing power of their investment. Finally, the combined result of adding the growth
5 rate to the market value dividend yield must provide a sufficient margin over yields of
6 public utility debt.

7
8 **Q. WHAT METHOD DID YOU USE TO ARRIVE AT YOUR GROWTH RATE**
9 **CONCLUSION?**

10 A. No single method is necessarily the correct method of estimating share value
11 growth. It is reasonable to assume that investors anticipate that the Water Group's current
12 ROE will expand to higher levels. The published historical earnings growth rates for the
13 Water Group averages 8.4%. Because there is not necessarily any single means of
14 estimating share value growth, I considered all of this information in determining a growth
15 rate conclusion for the Comparable Companies.

16 Moreover, while some rate of return practitioners would advocate that
17 mathematical precision should be followed when selecting a growth rate, the fact is that
18 investors do not behave in the same manner when establishing the market price for a stock.
19 Rather, investors consider both company-specific variables and overall market sentiment
20 such as inflation rates, interest rates and economic conditions when formulating their
21 capital gains expectations. This is especially true when one considers the relatively
22 meaningless negative growth rates. That is, use of a negative growth rate in a DCF implies
23 that investors invest with the expectation of losing money.

1 The range of growth rates previously summarized supports the reasonableness of
2 an expected 7.6% growth rate for the Water Group based primarily on the projected five-
3 year growth rates and considering the Water Group's industry projected EPS growth rates
4 of 9.3%. Like the projected growth rates, this investor-expected growth rate of 7.6% is
5 based on a survey of projected and historical growth rates published by established entities,
6 including First Call, Reuters, Zacks Investment Research and Value Line. Use of
7 information from these unbiased professional organizations provides an objective
8 estimation of investor's expectations of growth. Based on the aforesaid, all growth rates
9 for the Comparison Companies have been considered and have been given weight in
10 determining a 7.6% growth rate for the Water Group.

11
12 **Q. WHAT IS YOUR MARKET VALUE DCF ESTIMATE FOR THE COMPARABLE**
13 **COMPANIES?**

14 A. The market value DCF cost rate estimate for the Water Group is 9.7%, as detailed
15 on page 1 of Schedule 12.

16
17 **Q. ARE THERE OTHER CONSIDERATIONS THAT SHOULD BE TAKEN INTO**
18 **ACCOUNT IN REVIEWING A MARKET VALUE CAPITALIZATION DCF**
19 **COST RATE ESTIMATE?**

20 A. Yes. It should be noted that although I recommend specific dividend yields for the
21 Comparable Group, I recommend that less weight be given to the resultant market value
22 DCF cost rate due to the market's current market capitalization ratios and the impact that
23 the market-to-book ratio has on the DCF results. The Comparable Companies' current

1 market-to-book ratios of 326% and low dividend yields are being affected by the
2 aforementioned policy of the Federal Reserve that has resulted in the mispricing of capital
3 due to artificial interest rates, not DCF fundamentals.

4 Although the DCF cost for common equity appears to be based upon mathematical
5 precision, the derived result does not reflect the reality of the marketplace since the model
6 proceeds from unconnected assumptions. The traditional DCF derived cost rate for
7 common equity will continuously understate or overstate investors' return requirements as
8 long as stock prices continually sell above or below book value. A traditional DCF model
9 implicitly assumes that stock price will be driven to book value over time. However, such
10 a proposition is not rational when viewed in the context of an investor purchasing stock
11 above book value. It is not rational to assume that an investor would expect share price to
12 decrease 69% ($100\% \div 326\% = 31\% - 100\% = 69\%$) in value to equal book value.

13 Utility stocks do not trade in a vacuum. Utility stock prices, whether they are
14 above or below book value, reflect worldwide market sentiment and are not reflective of
15 only one element.

16
17 **Q. WHAT DO YOU MEAN BY YOUR STATEMENT THAT UTILITY STOCKS ARE**
18 **NOT TRADED IN A VACUUM?**

19 A. Utility stocks cannot be viewed solely by themselves. They must be viewed in the
20 context of the market environment. Table 8 summarizes recent market-to-book ratios
21 ("M/B") for well-known measures of market value reported in the December 24, 2018
22 issue of Barron's and the Water Group's average M/B as shown on page 1 of Schedule
23 14.

Table 8

	<u>M/B Ratios(%)</u>

Dow Jones Transportation	276
Dow Jones Utilities	200
S&P 500	292
S&P Industrials	383
Vs.	
Water Group	326

Utility stock investors view their investment decisions compared with other investment alternatives, including those of the various market measures shown in Table 8.

Q. HOW DOES A TRADITIONAL DCF IMPLICITLY ASSUME THAT MARKET PRICE WILL EQUAL BOOK VALUE?

A. Under traditional DCF theory, price will equal book value ($M/B=1.00$) only when a company is earning its cost of capital. Traditional DCF theory maintains that a company is under-earning its cost of capital when the market price is below book value ($M/B<1.00$), while a company over-earning its cost of capital will have a market price above its book value ($M/B>1.00$). If this were true, it would imply that the capitalistic free-market is not efficient because the overwhelming majority of stocks would currently be earning more than their cost of capital. Table 8 shows that most stocks sell at an M/B that is greater than 1.0.

1 **Q. PLEASE EXPLAIN WHY SUCH A PHENOMENON WOULD SHOW THAT THE**
2 **CAPITALISTIC FREE-MARKET IS NOT EFFICIENT.**

3 A. Historically, the S&P Industrials, which represented approximately 400 companies,
4 have sold at an M/B as low as 1.0 only one time out of the 53-year period 1947-1999.
5 Based upon the traditional DCF assumption, which suggests that companies with M/Bs
6 greater than 1.0 earn more than their cost of capital, this data would suggest that the S&P
7 Industrial companies have earned more than their cost of capital while competing in a
8 competitive environment over the 53-year period. In a competitive market, new
9 companies would continually enter the market up to the point that the earnings rate was at
10 least equal to their cost of capital.

11 During this period the S&P Industrials sold at an average M/B of 223.7% while
12 experiencing a ROE of 15.7% over a period in which interest rates averaged 7.2%. It is
13 important to note that the average ROE of 15.7% is relative to a common equity ratio of
14 more than 60% for the S&P Industrials over many years.

15
16 **Q. WHAT IS THE SIGNIFICANCE OF INDUSTRIAL COMPANIES' M/B AND THE**
17 **COST OF CAPITAL FOR A WATER UTILITY?**

18 A. As stated previously, utility stocks do not trade in a vacuum. They must compete
19 for capital with other firms including industrial stocks. Over time, there has been a
20 relationship between M/Bs of industrial stocks and utility stocks. Although industrial
21 stocks have sold at a higher multiple of book value than utility stocks, both have tracked in
22 similar directions. Because utility and industrial stock prices relative to book values move
23 in similar directions, it is irrational to conclude that stock prices that are different from

1 book value, either higher or lower, suggests that a firm is over-or under-earning its cost of
2 capital when competitive free-markets exist.

3
4 **Q. DOES THE MARKET VALUE DCF PROVIDE A REASONABLE ESTIMATE OF**
5 **THE WATER GROUP'S COMMON EQUITY COST RATE?**

6 A. No, the DCF only provides a reasonable estimate of the Comparable Group's
7 common equity cost rate when their market price and book value are similar
8 (M/B=100%).²⁵ A DCF will overstate a common equity cost rate when M/Bs are below
9 100% and understate when they are above 100%. Since the Comparable Group's current
10 M/Bs average 326%, the DCF understates their common equity cost rate. Schedule 15
11 provides a numerical illustration of the impact of M/Bs on investors' market returns and
12 DCF returns. The reason that DCF understates or overstates investors' return
13 requirements depending upon M/B levels is because a DCF-derived equity cost rate is
14 applied to a book value rate base while investors' returns are measured relative to stock
15 price levels. Based upon this, I recommend that less weight be given to the market value
16 DCF cost rate unless the increased financial risk, resulting from applying a market value
17 cost rate to a book value, is accounted for.

18
19 **Q. HOW DO YOU RESOLVE THE FINANCIAL RISK DIFFERENCE BETWEEN**
20 **MARKET VALUE COST RATES AND BOOK VALUE COST RATES?**

²⁵ Roger A Morin, Regulatory Finance - Utilities' Cost of Capital, Public Utility Reports, Inc., 1994, pp. 236-237.

1 A. The basic proposition of financial theory regarding the economic value of a
2 company is based on market value. That is, a company's value is based on its market
3 value weighted average cost of capital.²⁶ Accordingly, the market value derived cost rate
4 reflects the financial risk or leverage associated with capitalization ratios based on market
5 value, not book value. As shown on page 1 of Schedule 16, for the Water Group there is
6 a large difference in leverage as a result of the average \$2,916 million difference in market
7 value common equity and book value common equity. This difference in market values
8 and book values results in debt/equity ratios based on market value of 22.0%/78.0%
9 (debt/equity) verses 46.0%/54.0% (debt/equity) based on book value as shown on page 1
10 of Schedule 16.

11 Differences in the amount of leverage employed can be quantified based upon the
12 Comparable Group's leveraged beta being "unleveraged" through the application of the
13 "Hamada Formula". The details of the model are shown on page 2 of Schedule 16. For
14 example, the inputs to the formula for the Water Group market value capitalization consist
15 of their leveraged beta of 0.71, debt ratio of 21.7%, preferred stock ratio of 0.0%, common
16 equity ratio of 78.3% and combined tax rate of 29.00%. The group's unleveraged beta is
17 determined to be .55 through the use of the following Hamada formula:

²⁶ Shannon P. Pratt, Cost of Capital, John Wiley & Sons, Inc., 1998, pp. 45-46.

$$B_l = B_u (1 + (1 - t) D/E + P/E)$$

where:

B_l = observed, leveraged beta

B_u = calculated, unleveraged beta

t = income tax rate

D = debt ratio

P = preferred stock ratio

E = common equity ratio

Applying the unleveraged beta of 0.59 along with the Water Group's book value capitalization ratios of 45.8% long-term debt, 0.1% preferred stock and 54.1% common equity and combined tax rate of 29.00% results in a leveraged beta of .84 applicable to the group's book value capitalization. Based upon the Water Group's risk premium of 5.7% and the difference between Water Group's market value leveraged beta, their book value leveraged beta of 0.24 (0.95 - 0.71) indicates that the Water Group's common equity cost rate must be increased by 1.37 (0.24 x 5.7 = 1.37) in recognition of their book value's exposure to more financial risk.

Q. IS THERE ANOTHER WAY TO REFLECT THE FINANCIAL RISK DIFFERENCE THAT EXISTS AS A RESULT OF MARKET CAPITALIZATION RATIOS BEING SIGNIFICANTLY DIFFERENT FROM BOOK VALUE CAPITALIZATION RATIOS?

A. Yes, generally speaking. Although it is possible to know the direction of a financial risk adjustment on common equity cost rate, a specific quantification of financial

1 risk differences is very difficult. Although the end result of a financial risk adjustment is
 2 very subjective and specific quantification very difficult, the direction of the adjustment is
 3 clearly known. However, hypothetically if the Comparable Group's debt were rated based
 4 on market value debt ratios they would command an Aaa rating. The Comparison Group
 5 currently has bonds rated A based upon their book value debt ratios. The yield spread on
 6 a bond rated Aaa versus A rated bonds averages 32 basis points or 0.32% as shown on page
 7 3 of Schedule 16.

8 The end result of the application of the Hamada Model and the bond yield spread
 9 indicates that the Water Group market value common equity cost rate equity cost rate
 10 should be adjusted upward by at least 0.8% ($1.4\% \text{ hamada est.} + 0.3\% \text{ yield spread} = 1.7\%$
 11 $\div 2 = 0.8\%$) since it is going to be applied to a book value.

12 Accounting for the increased amount of leverage between market value derived
 13 DCF cost rates and book value cost rates indicates a book value DCF cost rate of 10.5%
 14 for the Water Group ($9.7\% + 0.8\% = 10.5\%$).
 15

16 **CAPITAL ASSET PRICING MODEL**

17 **Q. PLEASE BRIEFLY DESCRIBE THE THEORY OF THE CAPITAL ASSET**
 18 **PRICING MODEL.**

19 **A.** The CAPM is based upon the assumption that investors hold diversified portfolios
 20 and that the market only recognizes or rewards non-diversifiable (or systematic) risk when
 21 determining the price of a security because company-specific risk (or non-systematic) is
 22 removed through diversification. Further, investors are assumed to require additional or
 23 higher returns for assuming additional or higher risk. This assumption is captured by

1 using a beta that provides an incremental cost of additional risk above the base risk-free
2 rate available to investors. The beta of a security reflects the market risk or systematic
3 risk of the security relative to the market. The beta for the market is always equal to 1.00;
4 therefore, a company whose stock has a beta greater than 1.00 is considered riskier than
5 the market, and a company with a beta less than 1.00 is considered less risky than the
6 market. The base risk-free rate is assumed to be a U.S. Government treasury security
7 because they are assumed to be free of default risk.

8
9 **Q. WHAT RISK-FREE RATE AND BETA HAVE YOU USED IN YOUR CAPM**
10 **CALCULATION?**

11 A. The risk-free rate used in CAPM should have approximately the same maturity as
12 the life of the asset for which the cost rate is being determined. Because utility assets are
13 long-lived, a long-term Treasury Bond yield serves as an appropriate proxy. Previously,
14 I estimated an appropriate risk-free rate of 3.4% based upon the recent and forward long-
15 term Treasury yields. I used the average beta of 0.71 for the Water Group as shown on
16 page 1 of Schedule 17. However, as stated previously, the Comparable Group's betas are
17 understated due to their small size which affects their stock price changes.

18
19 **Q. AFTER DEVELOPING AN APPROPRIATE BETA AND RISK-FREE RATE,**
20 **WHAT ELSE IS NECESSARY TO CALCULATE A CAPM DERIVED COST**
21 **RATE?**

22 A. A market premium is necessary to determine a traditional CAPM derived cost rate.
23 The market return rate is the return expected for the entire market. The market premium

1 is then multiplied by the company specific beta to capture the incremental cost of additional
2 risk (market premium) above the base risk-free rate (long-term treasury securities) to
3 develop a risk adjusted market premium. For example, if you conclude that the expected
4 return on the market as a whole is 15% and further assume that the risk-free rate is 8%,
5 then the market premium is shown to be 7% ($15\% - 8\% = 7\%$).

6 Further, assume there are two companies, one of which is considered less risky than
7 the market, and therefore has a beta of less than 1.00 or 0.80. The second company has a
8 beta that is greater than 1.00 or 1.20, and is therefore considered riskier than the market.
9 By multiplying the hypothetical 7.0% market premium by the respective betas of 0.80 and
10 1.20, risk adjusted market premiums of 5.6% ($7.0\% \times 0.80$) and 8.4% ($7.0\% \times 1.20$) are
11 shown for the company considered less risky than the market and for the company
12 considered more risky than the market, respectively.

13 Adding the assumed risk-free rate of 8% to the risk adjusted market premiums
14 results in the CAPM derived cost rates of 13.6% ($5.6\% + 8.0\%$) for the less risky company
15 and 16.4% ($8.4\% + 8.0\%$) for the company considered of greater risk than the market. In
16 fact, the result of this hypothetical CAPM calculation shows that: (1) the least risky
17 company, with the beta of 0.80, has a cost rate of 13.6%; (2) the market, with the beta of
18 1.00, has a cost rate of 15.0%; and (3) that the higher risk company, with a beta of 1.20,
19 has a cost rate of 16.4%.

20
21 **Q. HOW DID YOU DEVELOP A MARKET PREMIUM FOR YOUR CAPM?**

22 A. The average projected market premium of 9.0% is developed on page 2 of Schedule
23 17. It is based upon Value Line's average projected total market return for the next three

1 to five years of 12.4% less the risk free rate of 3.4%. I also reviewed market premiums
2 derived from Ibbotson Associates' most recent publication concerning asset returns that
3 show a market premium of 6.9%. The Ibbotson Associates' market premium may be on
4 the low side reflective of the higher interest rate environment found during their study (*i.e.*,
5 5.0%). Equally, the Value Line market premium reflects the Federal Reserve's current
6 artificial interest rate levels while the Ibbotson Associates' market premiums reflect a
7 higher interest rate environment.

8
9 **Q. HOW DID YOU ADJUST FOR THE IMPACT THAT SIZE HAS ON THE**
10 **COMPARABLE GROUP'S BETA?**

11 A. The adjustment is reflected in the CAPM size premium. The CAPM size premium
12 is developed on page 4 of Schedule 17. The size premium reflects the risks associated
13 with the Comparable Group's small size and its impact on the determination of their beta.
14 This adjustment is necessary because beta (systematic risk) does not capture or reflect the
15 Comparable Group's small size. I reduced the size premium by the ratio of the
16 Comparison Group's beta to their respective market quartile's beta.

17
18 **Q. WHAT IS THE COMPARISON GROUP'S MARKET COST OF EQUITY BASED**
19 **UPON YOUR CAPM CALCULATION?**

20 A. The CAPM based on Ibbotson Associates' historical market returns shows a market
21 cost rate of 9.2% for the Water Group. The CAPM based on Value Line's projected
22 market returns shows an 10.7% for the Water Group, as shown on page 1 of Schedule 17.
23 The Comparable Group's average market value CAPM of 10.0% is based 50% on the

1 results of the historical market returns and 50% on the projected market returns. Adjusting
2 the market value CAPM based upon the end result of the application of the Hamada Model
3 and the bond yield spread to account for the difference in leverage between market value
4 capitalization ratios and book value ratios discussed previously indicates a cost rate of
5 10.8% for the Water Group applicable to book value ($10.0\% + 0.8\% = 10.8\%$).

RISK PREMIUM

8 **Q. WHAT IS A RISK PREMIUM?**

9 A. A risk premium is the common equity investors' required premium over the long-
10 term debt cost rate for the same company, in recognition of the added risk to which the
11 common stockholder is exposed versus long-term debtholders. Long-term debtholders
12 have a stated contract concerning the receipt of dividend and principal repayment whereas
13 common stock investors do not. Further, long-term debtholders have the first claim on
14 assets in case of bankruptcy. A risk premium recognizes the higher risk to which a
15 common stock investor is exposed. The risk premium-derived cost rate for common
16 equity is the simplest form of deriving the cost rate for common equity because it is nothing
17 more than a premium above the prospective level of long-term corporate debt.

19 **Q. WHAT IS THE APPROPRIATE ESTIMATED FUTURE LONG-TERM**
20 **BORROWING RATE FOR THE COMPARABLE COMPANIES?**

21 A. The estimated near term long-term borrowing rate for the Comparable Companies
22 is 4.6% based upon their credit profile that supports an A bond rating.

1 **Q. WHAT IS THE APPROPRIATE RISK PREMIUM TO BE ADDED TO THE**
2 **FUTURE LONG-TERM BORROWING RATE?**

3 A. To determine a common equity cost rate, it is necessary to estimate a risk premium
4 to be added to the Comparable Group's prospective long-term debt rate. Investors may
5 rely upon published projected premiums; they also rely upon their experiences of investing
6 in ultimately determining a probabilistic forecasted risk premium.

7 Projections of total market returns are shown on page 2 of Schedule 18. A
8 projected risk premium for the market can be derived by subtracting the debt cost rate from
9 the projected market return as shown on page 2 of Schedule 18. However, the derived
10 risk premium for the market is not directly applicable to the Comparable Companies
11 because they are less risky than the market. The use of 90% of the market's risk is a
12 conservative estimation of their level of risk as compared to the market.

13 The midpoint of the risk premium range is 7.1 and the average for the most recent
14 quarter is 7.3% as shown on page 2 of Schedule 18. Based on this, a reasonable estimate
15 of a longer term projected risk premium is 7.2%.
16

17 **Q. HOW DO INVESTORS' EXPERIENCES AFFECT THEIR DETERMINATION OF**
18 **A RISK PREMIUM?**

19 A. Returns on various assets are studied to determine a probabilistic risk premium.
20 The most noted asset return studies and resultant risk premium studies are those performed
21 by Ibbotson Associates. However, Ibbotson Associates has not performed asset return
22 studies concerning public utility common stocks. Based upon Ibbotson Associates'
23 methodology of computing asset returns, I calculated annual returns for the S&P utilities

1 and bonds for the period 1928-2017. The resultant annual returns were then compared to
2 determine a recent risk premium from a recent 20-year period, 1998-2017 and subsequent
3 periods that were each increased by ten years until the entire study period was reviewed
4 (pages 3 and 4 of Schedule 18).

5 A long-term analysis of rates of return is necessary because it assumes that
6 investors' expectations are, on average, equal to realized long-run rates of return and
7 resultant risk premium. Observing a single year's risk premium, either high or low, may
8 not be consistent with investors' requirements. Further, studies show a mean reversion in
9 risk premiums. In other words, over time, risk premiums revert to a longer-term average
10 premium. Moreover, since the expected rate of return is defined as "the rate of return
11 expected to be realized from an investment; the mean value of the probability distribution
12 of possible results,"²⁷ a long-term analysis of annual returns is appropriate.

13
14 **Q. WHAT DO YOU CONCLUDE FROM THE INFORMATION SHOWN ON**
15 **PAGES 3 AND 4 OF SCHEDULE 18?**

16 A. The average of the absolute range of the S&P Utilities' appropriate average risk
17 premium (i.e., bonds rated AAA to A) was 4.0% during the seven periods studied, as
18 calculated from page 3 of Schedule 18. The credit adjusted longer term risk premiums
19 (i.e., bonds rated A), 1928-2017, and averages 4.2%. The appropriate average (i.e., bonds
20 rated AAA to A) longer term risk premiums, 1928-2017, have an absolute range of 4.2%
21 to 5.1%, and averages 4.6%.

²⁷ Eugene F. Brigham, Fundamentals of Financial Management, Fifth Edition, The Dryden Press, 1989, p. 106.

1 The aforementioned premiums are based on total returns for bonds; and reflect their price
2 risk. A bond's price risk is not related to its credit quality and is eliminated when a bond
3 is held to maturity from time of purchase. Using the income returns, page 4 of Schedule
4 18, for bonds eliminates price risk and better measures an investor's required return based
5 on credit quality. The appropriate average risk premium (i.e., bonds rated AAA to A)
6 based on income returns was 5.1% during the seven periods studied. The credit adjusted
7 longer term risk premiums (i.e., bonds rated A), 1928-2017, and averages 4.7%. The
8 appropriate average (i.e., bonds rated AAA to A) longer term risk premiums, 1928-2017,
9 have an absolute range of 4.7% to 5.1%, and averages 4.9%.

10
11 **Q. WHAT INFORMATION IS SHOWN ON PAGE 5 OF SCHEDULE 18?**

12 A. Page 5 of Schedule 18 proves and measures the negative relationship between
13 interest rate levels and the resulting risk premium. That is, risk premiums are generally
14 higher when interest rates are low and risk premiums are generally lower when interest
15 rates are high. This was proven by sorting the 90-year period, 1928 to 2017, annual
16 returns based on interest rate level from lowest interest rate to highest interest rate and
17 distributing the results into two equal groups, a 45-year low interest rate environment group
18 and a 45-year high interest rate environment group.

19 During the period 1928-2017, the 45 years with the lowest interest rates had an
20 average interest rate of 3.0% and reflected a range of interest rates from 2.0% to 4.1%.
21 This period resembles the current interest rate environment of 3.4% discussed previously
22 regarding the CAPM's risk free rate. The risk premium based on total returns during this
23 low interest rate environment produced the appropriate average (i.e., bonds rated AAA to

1 A) longer term risk premium of 6.5% and a credit adjusted longer term risk premium (i.e.,
2 bonds rated A) of 5.7%. The annual income return based risk premium during this low
3 interest rate environment produced the appropriate average (i.e., bonds rated AAA to A)
4 longer term risk premium of 7.4% and a credit adjusted longer term risk premium (i.e.,
5 bonds rated A) of 7.1%.

6 However, during the period 1928-2017, the 45 years with the highest interest rates
7 had an average interest rate of 7.3% and reflected a range of interest rates from 4.2% to
8 13.5%. This period is far different from the current interest rate environment of 3.4%.
9 The risk premium based on total returns during the highest interest rate environment
10 produced an average longer term risk premium of 2.7% over bonds rated AAA to A and a
11 credit adjusted longer term risk premium (i.e., bonds rated A) of only 2.6%. The annual
12 income return based risk premium during the highest interest rate environment produced
13 an average longer term risk premium of 2.5% over bonds rated AAA to A and a credit
14 adjusted longer term risk premium (i.e., bonds rated A) of only 2.4%.

15 Over time, risk premiums are mean reverting. They constantly move toward a
16 long-term average reflecting a long-term level of interest rates. That is, an above-average
17 risk premium will decrease toward a long-term average while a below-average risk
18 premium will increase toward a long-term average. In any single year, of course, investor-
19 required rates of return may not be realized and in certain instances, a single year's risk
20 premiums may be negative. Negative risk premiums are not indicative of investors'
21 expectations and violate the basic premise of finance concerning risk and return. Negative
22 risk premiums usually occur only in the stock market's down years (*i.e.*, the years in which
23 the stock markets' return was negative).

1 When interest rate levels are not considered the credit adjusted longer term risk
2 premium (i.e., bonds rated A), 1928-2017, averages 4.7%, discussed previously regarding
3 page 4 of Schedule 21. However, the annual income return based risk premium during
4 the low interest rate environment produced a credit adjusted longer term risk premium (i.e.,
5 bonds rated A) of 7.1%. Since this period resembles the current interest rate environment
6 of 3.4%, a reasonable estimate of investors risk premium based on historical returns is
7 based on an average of the results of the entire 1928-2017 historical market returns, the
8 results of the low interest rate environment, along with the projected market returns to
9 produce a 5.7% risk premium.

10 Adding the risk premium of 5.7% for the Comparable Group to the prospective cost
11 of newly-issued long-term debt of 4.6% results in a market value risk premium derived
12 cost rate for common equity of 10.3% as reflected on page 1 of Schedule 18. Adjusting
13 the market value risk premium based upon the end result of the application of the Hamada
14 Model and the bond yield spread to account for the difference in leverage between market
15 value capitalization and book value ratios discussed previously indicates a cost rate of
16 11.1% applicable to book value ($10.3\% + 0.8\% = 11.1\%$).

18 **SUMMARY OF COMMON EQUITY COST RATE**

19 **Q. WHAT IS YOUR COMPARABLE GROUP'S COMMON EQUITY COST RATE?**

20 A. Based upon the results of the models employed, the Water Group's common equity
21 cost rate is in the range of 10.5% to 11.1% as reflected on Schedule 19. Based upon this
22 data, the common equity cost rate for the Water Group is at least 10.75%. My
23 recommendation is based upon the Water Group's 10.75% common equity cost rate.

Q. DO YOU RECOMMEND A COST OF COMMON EQUITY OF 10.75% FOR PWR?

A. Yes. Based upon the financial analysis and risk analysis, I conclude that PWR is exposed to overall similar investment risk as the Comparable Group. This is evidenced by PWR's small size, lower credit profile and the other factors summarized in Table 5 discussed previously being counter balanced by a thicker common equity ratio. The results of the three models employed for the Water Group shows a current range of common equity cost applicable to book value of PWR of 10.50% (DCF), 10.80% (CAPM), and 11.10% (RP) as shown in Table 9.

Table 9

Summary of the PWR's Equity Cost Rates	
DCF	10.50
CAPM	10.80
RP	11.10

Q. WHAT IS YOUR COMMON EQUITY COST RATE RECOMMENDATION FOR PWR?

A. As discussed above and as shown in Schedule 19, I recommend a 10.75% common equity cost rate for PWR.

Q. HAVE YOU CHECKED THE REASONABLENESS OF YOUR RECOMMENDED COMMON EQUITY RATE FOR PWR?

A. Yes. Page 2 of Schedule 14 reflects the average projected earned return on average book common equity for the companies in the Comparable Group for the period 2021-

2023, which is shown to range from 10.5% to 14.0%. Given the large degree to which regulatory lag and attrition impacts water utilities earning, the range of the comparable utilities' projected earned returns suggests that my recommendation that PWR be permitted an opportunity to earn 10.75% is reasonable, if not conservative.

OVERALL RATE OF RETURN RECOMMENDATION

Q. WHAT IS YOUR OVERALL FAIR RATE OF RETURN RECOMMENDATION FOR THE PWR?

A. Based upon the recommended capital structure and my estimate of the PWR's common equity cost rate, I recommend an overall fair rate of return of 8.45%. The details of my recommendation are shown on Schedule 1.

Q. HAVE YOU TESTED THE REASONABLENESS OF YOUR OVERALL FAIR RATE OF RETURN RECOMMENDATION?

A. Yes. If my recommended overall rate of return is actually earned, it will give PWR ratios that will allow PWR to present a financial profile that will enable it to attract capital necessary to provide safe and reliable wastewater service, at reasonable terms.

Q. DOES THAT CONCLUDE YOUR DIRECT TESTIMONY?

A. Yes, it does.

APPENDIX A

Professional Qualifications
of
Harold Walker, III
Manager, Financial Studies
Gannett Fleming Valuation and Rate Consultants, LLC.

EDUCATION

Mr. Walker graduated from Pennsylvania State University in 1984 with a Bachelor of Science Degree in Finance. His studies concentrated on securities analysis and portfolio management with an emphasis on economics and quantitative business analysis. He has also completed the regulation and the rate-making process courses presented by the College of Business Administration and Economics Center for Public Utilities at New Mexico State University. Additionally, he has attended programs presented by The Institute of Chartered Financial Analysts (CFA).

Mr. Walker was awarded the professional designation “Certified Rate of Return Analyst” (CRRRA) by the Society of Utility and Regulatory Financial Analysts. This designation is based upon education, experience and the successful completion of a comprehensive examination. He is also a member of the Society of Utility and Regulatory Financial Analysts (SURFA) and has attended numerous financial forums sponsored by the Society. The SURFA forums are recognized by the Association for Investment Management and Research (AIMR) and the National Association of State Boards of Accountancy for continuing education credits.

Mr. Walker is also a licensed Municipal Advisor Representative (Series 50) by Municipal Securities Rulemaking Board (MSRB) and Financial Industry Regulatory Authority (FINRA).

BUSINESS EXPERIENCE

Prior to joining Gannett Fleming Valuation and Rate Consultants, LLC., Mr. Walker was employed by AUS Consultants - Utility Services. He held various positions during his eleven years with AUS, concluding his employment there as a Vice President. His duties included providing and supervising financial and economic studies on behalf of investor owned and municipally owned water, waste water, electric, natural gas distribution and transmission, oil pipeline and telephone utilities as well as resource recovery companies.

In 1996, Mr. Walker joined Gannett Fleming Valuation and Rate Consultants, LLC. In his capacity as Manager, Financial Studies and for the past twenty years, he has continuously studied rates of return requirements for regulated firms. In this regard, he supervised the preparation of rate of return studies in connection with his testimony and in the past, for other individuals. He also assisted and/or developed dividend policy studies, nuclear prudence studies, calculated fixed charge rates for avoided costs involving cogeneration projects, financial decision studies for capital budgeting purposes and developed financial models for determining future capital requirements and the effect of those requirements on investors and ratepayers, valued utility property and common stock for acquisition and divestiture, and assisted in the private placement of fixed capital securities for public utilities.

Head, Gannett Fleming GASB 34 Task Force responsible for developing Governmental Accounting Standards Board (GASB) 34 services, and educating Gannett Fleming personnel and Gannett Fleming clients on GASB 34 and how it may affect them. The GASB 34 related services include inventory of assets, valuation of assets, salvage estimation, annual depreciation rate determination, estimation of depreciation reserve, asset service life determination, asset condition assessment, condition assessment documentation, maintenance estimate for asset preservation, establishment of condition level index, geographic information system (GIS) and data management services, management discussion and analysis (MD&A) reporting, required supplemental information (RSI) reporting, auditor interface, and GASB 34 compliance review.

Mr. Walker was also the Publisher of C.A. Turner Utility Reports from 1988 to 1996. C.A. Turner Utility Reports is a financial publication which provides financial data and related ratios and forecasts covering the utility industry. From 1993 to 1994, he became a contributing author for the Fortnightly, a utility trade journal. His column was the Financial News column and focused mainly on the natural gas industry.

In 2004, Mr. Walker was elected to serve on the Board of Directors of SURFA. Previously, he served as an ex-officio directors as an advisor to SURFA's existing President. In 2000, Mr. Walker was elected President of SURFA for the 2001-2002 term. Prior to that, he was elected to serve on the Board of Directors of SURFA during the period 1997-1998 and 1999-2000. Currently, he also serves on the Pennsylvania Municipal Authorities Association, Electric Deregulation Committee.

EXPERT TESTIMONY

Mr. Walker has submitted testimony or been deposed on various topics before regulatory commissions and courts in 22 states including: Arizona, California, Colorado, Connecticut, Delaware, Illinois, Indiana, Kentucky, Maryland, Massachusetts, Michigan, Missouri, New Hampshire, New Jersey, New York, North Carolina, Oklahoma, Pennsylvania, Rhode Island, Vermont, Virginia, and West Virginia. His testimonies covered various subjects including: fair market value, the taking of natural resources, appropriate capital structure and fixed capital cost rates, depreciation, fair rate of return, purchased water adjustments, synchronization of interest charges for income tax purposes, valuation, cash working capital, lead-lag studies, financial analyses of investment alternatives, and fair value. The following tabulation provides a listing of

the electric power, natural gas distribution, telephone, wastewater, and water service utility cases in which he has been involved as a witness. Additionally, he has been involved in a number of rate proceedings involving small public utilities which were resolved by Option Orders and therefore, are not listed below.

Palmetto Wastewater Reclamation, LLC (Consolidated)
Five Year Analysis
2013-2017

Notes:

- (1) Combined results for each individual company based upon the financials as originally reported. The companies included are: Palmetto Wastewater Reclamation, LLC - Alpine Utilities and Palmetto Wastewater Reclamation, LLC - Woodland Utilities.
- (2) Computed by relating total debt interest, long-term debt interest and preferred dividend expense to average of beginning and ending balance of the respective capital outstanding.
- (3) The coverage calculations, both including and excluding AFC, represent the number of times available earnings cover the various fixed charges. It should be noted that the pretax coverage including preferred dividends has been grossed up for the income tax paid on the preferred dividends.
- (4) GCF or gross cash flow (sum of net income, depreciation, amortization, net deferred income taxes and investment tax credits, less AFC), plus interest charges, divided by interest charges.
- (5) GCF (see note 4) less all preferred dividends which cover common dividends.
- (6) The percent of GCF (see note 4) less all cash dividends which cover gross construction expenditures.
- (7) GCF (see note 4) as a percentage of Permanent Capital (long-term debt, current maturities and preferred, preference and common equity).
- (8) GCF (see note 4) as a percentage of average total debt.
- (9) Average of the second, third and fourth quintile values.

See page 2 of this Schedule for notes.

S&P Public Utilities
Five Year Analysis
2013-2017

Notes:

- (1) Market value weighted achieved results for each individual company based upon the financials as originally reported.
- (2) Computed by relating total debt interest, long-term debt interest and preferred dividend expense to average of beginning and ending balance of the respective capital outstanding.
- (3) The coverage calculations, both including and excluding AFC, represent the number of times available earnings cover the various fixed charges. It should be noted that the pretax coverage including preferred dividends has been grossed up for the income tax paid on the preferred dividends.
- (4) GCF or gross cash flow (sum of net income, depreciation, amortization, net deferred income taxes and investment tax credits, less AFC), plus interest charges, divided by interest charges.
- (5) GCF (see note 4) less all preferred dividends which cover common dividends.
- (6) The percent of GCF (see note 4) less all cash dividends which cover gross construction expenditures.
- (7) GCF (see note 4) as a percentage of Permanent Capital (long-term debt, current maturities and preferred, preference and common equity).
- (8) GCF (see note 4) as a percentage of average total debt.
- (9) Average of the second, third and fourth quintile values.

Comparative Ratios For
Palmetto Wastewater Reclamation, LLC (Consolidated),
The Water Group Followed by Analysts,
The S&P Utilities, and the S&P 500
For the Years 2013-2017 (1)

Notes:

- (1) The average of achieved results for the companies in each group. The information for the S&P Public Utilities is market weighted. The information for the S&P 500 is based upon per share information adjusted to price index level.
- (2) Rate of Return on Average Book Common Equity - income available for common equity divided by average beginning and ending year's balance of book common equity.
- (3) Market/Book Ratio - average of yearly high-low market price divided by the average of beginning and ending year's book value per share.
- (4) Earnings/Price Ratio - reported earnings per share yearly divided by the average of yearly high-low market price.
- (5) Dividend Payout Ratio is computed by dividing the yearly reported dividends paid by the yearly income available for common equity.
- (6) Dividend Yield - yearly dividend per share divided by the average yearly high-low market price.

Comparison of Credit Market Financial Risk Metrics
For Palmetto Wastewater Reclamation, LLC (Consolidated) and
The Water Group Followed by Analysts
2013 - 2017

Notes:

- (1) Average of the achieved results for each individual company based upon the financials as originally reported.
- (2) Represents the number of times available pretax earnings ("EBIT"), excluding AFC, cover all interest charges.
- (3) GCF or gross cash flow (sum of net income, depreciation, amortization, net deferred income taxes and investment tax credits, less AFC), plus interest charges, divided by interest charges.
- (4) GCF (see note 3) as a percentage of average total debt.
- (5) The percent of GCF (see note 3) less all cash dividends which cover gross construction expenditures.
- (6) Construction expenditures as a percentage of average total capital.
- (7) Funds from operations ("FFO"), revenue minus operating expenses, plus depreciation and amortization expenses ("EBITDA") less net interest expense less current tax expense, as a percentage of average total debt.
- (8) Average total debt divided by EBITDA (see note 7).
- (9) FFO (see note 7) plus interest charges, divided by interest charges.
- (10) EBITDA (see note 7) divided by interest charges.
- (11) Cash flow from operations ("CFO"), GCF (see note 3) plus changes in operating assets and liabilities (working capital), as a percentage of average total debt.
- (12) Free operating cash flow ("FOCF"), CFO (see note 11) minus capital expenditures, as a percentage of average total debt.
- (13) Discretionary cash flow ("DCF"), FOCF (see note 12) minus cash dividends as a percentage of average total debt.
- (14) The percent of GCF (see note 3) less all cash dividends as a percentage of average total debt.
- (15) Average total debt divided by average of total capital plus deferred taxes (balance sheet).
- (16) Funds from operations ("FFO"), revenue minus operating expenses, plus depreciation and amortization expenses ("EBITDA") less net interest expense less current tax expense, as a percentage of average total capital.
- (17) Average total capital divided by EBITDA (see note 7).
- (18) Cash flow from operations ("CFO"), GCF (see note 3) plus changes in operating assets and liabilities (working capital), as a percentage of average total capital.
- (19) Free operating cash flow ("FOCF"), CFO (see note 11) minus capital expenditures, as a percentage of average total capital.
- (20) Discretionary cash flow ("DCF"), FOCF (see note 12) minus cash dividends as a percentage of average total capital.
- (21) GCF (see note 3) as a percentage of average total capital.
- (22) The percent of GCF (see note 3) less all cash dividends as a percentage of average total capital.

Illustration of the
Effect of Market-To-Book Ratio on Market Return

<u>Ln #</u>	<u>Situation 1</u>	<u>Situation 2</u>	<u>Situation 3</u>
1 M/B Ratio	50%	100%	200%
2 Market Purchase Price	\$25.00	\$50.00	\$100.00
3 Book Value	\$50.00	\$50.00	\$50.00
4 DCF Return	10.0%	10.0%	10.0%
5 DCF Dollar Return	\$5.00	\$5.00	\$5.00
6 Dividend Yield	5.0%	5.0%	5.0%
7 DPS	\$1.25	\$2.50	\$5.00
8 Dollar Growth in Value	\$3.75	\$2.50	\$0.00
9 Market Sale Price	\$28.75	\$52.50	\$100.00
10 Total Market Return	20.0%	10.0%	5.0%

"The simple numerical illustration....demonstrates the impact of market-to-book ratios on the DCF market return....The DCF cost rate of 10%, made up of a 5% dividend yield and a 5% growth rate, is applied to the book value rate base of \$50 to produce \$5.00 of earnings. Of the \$5.00 of earnings, the full \$5.00 are required for dividends to produce a dividend yield of 5.0% on a stock price of \$100.00, and no dollars are available for growth. The investor's return is therefore only 5% versus his required return of 10%. A DCF cost rate of 10%, which implies \$10.00 of earnings, translates to only \$5.00 of earnings on book value, or a 5% return.....Therefore, the DCF cost rate understates the investor's required return when stock prices are well above book, as is the case presently."

The above illustration is taken from Roger A Morin, Regulatory Finance - Utilities' Cost of Capital, Public Utility Reports, Inc., 1994, pp. 236-237.

CAPM
The Water Group Followed by Analysts

- Notes: (1) A projected market premium is based upon the projected market return rate derived from the Value Line Summary and Index for the various dates shown. For example, Value Line projects (Nov-18) that the market will appreciate in price 55% over the next three to five years. Using a four-year midpoint estimate, Value Line's appreciation potential equates to 11.6% annually ($[1.55]^{.25}$). Additionally, Value Line estimates the market will have a dividend yield of 2.2%. Combining the market dividend yield of 2.2% with the market appreciation results in a projected market return rate of 13.8% (11.6% + 2.2%).
- (2) Mid point of the month-end total market returns in Column E.
- (3) Average total market return in Column E.
- (4) As discussed in the direct testimony, the risk-free rate is 3.4%.
- (5) The historical market premium is based upon studies conducted by Ibbotson Associates concerning asset returns. Ibbotson Associates' asset return studies are the most noted asset return rate studies available today. The results are widely disseminated throughout the investment public. Ibbotson Associates' long-term common stock total market return is 11.95% which, when reduced by the long-term historic risk-free rate of 5.02% results in a market premium of 6.9% (11.95% - 5.02%).
